

What is CloudFlare?

Integrated into your hosting account, CloudFlare is an advanced content delivery network, or CDN. When activated, it improves the performance and efficiency of a website in a number of ways:

- **Faster** - CloudFlare automatically caches copies of your content on servers all over the world. Visitors accessing your websites receive content from geographically closer servers, making your website load faster.
- **Safer** - CloudFlare screens all traffic through advanced firewalls to block threats that otherwise hog bandwidth and threaten server resources.
- **Smarter** - CloudFlare provides always-on technology. If your web server were to experience difficulties, visitors still see cached content with a notice explaining that the original host server is temporarily offline.

How do I activate CloudFlare?

CloudFlare is built directly into your Bluehost account. Enable the service on any of your domains or subdomains and CloudFlare will automatically activate without any software or coding changes.

basic **FREE**

- Worldwide CDN
- Intelligent threat protection
- Asynchronous Javascript loading
